## AI Assistant

+ New Chat

## Explanation

1. Use the **Calculated Items** - **analyze or calculate items** action to multiply the market margin by totalized lost production for lost opportunity cost.

Attempting to create the following calculation(s): Lost Opportunity Cost with the corresponding formula(s):

seeq formula

```
// Step 1: Multiply U26 Market Margin by  
Totalized Lost Production  
$lost_opportunity_cost = $market_margin *  
$totalized_lost_production  
  
// Output  
return $lost_opportunity_cost
```

 **Success**

Created: 1 items

Document my analysis. Add it to the top of the journal.

Explanation

1. Use the **Journal - create journal entries** action to document the analysis and add it to the top of the journal.

Success

The analysis has been documented with a clear narrative on the production losses and opportunity cost calculations. Two TrendLinks have been embedded—one for the Lost Production calculation and one for the Lost Opportunity Cost calculation. The documentation has been added to the top of your Journal.

create a scaling table search to find all my flow tags that start with FL1 or VMF

**Explanation**

1. Use the **Scaling Table - add to scaling table** action to search for all flow tags that start with FL1 or VMF.

**Success**

Here's a search that will find all flow tags that start with 'FL1' or 'VMF'.

Instruct me to create items or how to change your display

1. Use the **Scaling Table - add to scaling table** action to search for all flow tags that start with FL1 or VMF.

**Success**

Here's a search that will find all flow tags that start with 'FL1' or 'VMF'.

Now make a new column called Unit that extracts the Unit value from that column - the value U(any #s)

**Explanation**

1. Use the **Scaling Table - create columns** action to add a new column called Unit that extracts the Unit value from the column with the pattern U(any #s).

**Success**

Create a new column called 'Unit' that extracts the unit value from the 'Search Items Name' column, specifically the pattern 'U' followed by any numbers.

- Data Lab Environment Manager is available to help with transition

## Data Lab Environment Manager

This tool helps Data Lab users transition their Notebooks between different Python versions, manage projects, and handle Python packages effectively.

For detailed instructions, please refer to the full documentation.

This project has been verified to work with Python 3.11.

Paragraph

All signals

In this demo, we're using Partial Least Squares regression to model and understand what drives product quality in a process.

We have four key input signals: feed flow, reactor temperature, agitator speed, and reactant concentration. These are our predictors.

Our output signal is the Product Quality Detector, and we want to see how much of it we can explain using the inputs.

By applying PLS, we can uncover:

- The relative importance of each input signal
- How much variance in product quality can be captured by these inputs

Insights into underlying process behavior for optimization and troubleshooting.

We will identify 2 issues - a subtle issue with reactant concentration and an issue with the reactor temperature which could signal an issue with a heat exchanger.

Analysis Documentation

This analysis evaluates the prediction deviation by following a sequential calculation hierarchy starting from the sensor data used in the product quality detector, and proceeding through the residual computations, smoothing, and ultimately the derivation of the prediction deviation condition. Each step is represented by a trend link that captures both the inputs and outputs involved in that stage.
